In class activity 9: Correlation and Linear Regression

Introduction

This document demonstrates key concepts in correlation and regression analysis using ecological examples, focusing on:

1. **Understanding correlation vs. regression**
2. **Calculating and interpreting correlation coefficients**
3. **Testing correlation assumptions**
4. **Performing simple linear regression**
5. **Checking regression assumptions**
6. **Interpreting regression output and ANOVA tables**

We'll work with real ecological datasets to practice these concepts.
